Lab 9 - Participation Activity 7 - SOLUTION

NOTE: You will very likely get different memory addresses.

Execution #	Memory address of local variable password
1	0x7ffc9118d4a7
2	0x7ffd98de1467
3	0x7fffdd317967
4	0x7ffc5925fe57
5	0x7ffd4e773057
6	0x7ffe906e74a7
7	0x7ffc47ff8787
8	0x7ffe7ff57a47
9	0x7ffe1c675017
10	0x7ffdfdfc7ae7

The **range of variance** is range is 15387980256 bytes, which is between 2^{33} and 2^{34} bytes

Show the work you needed to do in order to compute your answer above on the back of this sheet.

Conclusion – Circle the appropriate verb:

I **confirm** or disprove the fact that our **target machine** does implement Stack Randomization.

Show the work you needed to do in order to compute your answer above on the back of this sheet.

Range of variance in the memory addresses I obtained over the 10 executions of the password program is the difference between the largest and smallest memory addresses:

Hex value:

$$0x7fffdd317967 - 0x7ffc47ff8787 = 0x39531F1E0$$

Decimal value:

$$140736904395111 - 140721516414855 = 15387980256$$

Since this experiment has been done on our target machine and this machine is a byte-addressable machine, the range is 15387980256 bytes, which is between 2^{33} and 2^{34} .
